## I. Introduction ${ }^{1}$

## 1. The purpose of this paper is to present the results of updating the data set used

 for quota calculations through 2004. This updated data set will provide the basis for discussions on possible adjustments in the distribution of quotas in the period leading up to the Annual Meetings. ${ }^{2}$ The paper is organized as follows: Section II describes the methodologies used to update the data set. Section III discusses the impact of the data update on the distribution of calculated quotas among major country groups. More detailed information on the methodology used and results of the updated quota calculations are presented in the appendices.
## II. The Data Set

## 2. Staff has updated the data set used for quota calculations for $\mathbf{1 8 4}$ members

 through 2004. The updated data set for individual members is presented in Table A1 (Statistical Appendix) both for the traditional economic and financial variables used in the existing five formulas ${ }^{3}$ and for alternative variables that have been discussed by the Executive Board.- The data were drawn mainly from International Financial Statistics (IFS) and the World Economic Outlook (WEO). ${ }^{4}$ Missing data series were computed based on staff reports, and in a few instances, country desk data and data from the Eleventh General Review of Quotas. ${ }^{5}$
- Data adjustments were made for a subset of members with significant re-exports, international banking interest (IBI), and/or transactions in non-monetary gold. Such adjustments have been made in previous quota reviews at the point at which consideration is being given to adjustments in members' quotas. ${ }^{6}$

[^0]3. The adjustments to the balance of payments data affect the quota calculations for 27 members. ${ }^{7}$ Fifteen countries were adjusted for re-exports, ${ }^{8} 13$ countries (comprising the G-10 plus Luxembourg and China, P.R., and Hong Kong SAR) were adjusted for IBI; and 3 countries (Japan, Switzerland, and United States) were adjusted for transactions in non-monetary gold. Details are provided in Appendix III.

## 4. Alternative variables measuring GDP and variability that have been considered

 by the Board were also updated (Box 1). These variables are the three-year average of GDP at market prices and variability of current receipts and net capital flows. ${ }^{9}$ The updated data for these variables are reported in Table 1 (and Tables A1 and A2).
## Box 1. Quota Formulas-Specification of Alternative Variables

At the most recent discussion on this issue, in September 2005, most Directors reconfirmed that a revised formula should be based on an updating of the traditional economic and financial variables, and comprise at most four variables. ${ }^{1}$ These variables include GDP as the most important indicator of economic size, a measure of openness, variability, and official international reserves. Directors have generally agreed that the three-year average of GDP at market prices is the most important variable to be included in any new formula as an indicator of countries' economic size and of their potential to either provide resources to the Fund or use Fund resources. Directors have also generally agreed that variability be specified as deviations from a three-year average, which would serve to smooth trends while adequately capturing fluctuations in capital flows. ${ }^{2}$

1/ See The Chairman's Concluding Remarks: Quota and Voice-Further Considerations (9/22/05, www.imf.org).
2/ See Public Information Notice: IMF Executive Board Discusses Quota Formulas (6/14/02, www.imf.org).

## III. Updated Quota Calculations

5. The existing five formulas were used with the updated data set to estimate calculated quotas and quota shares for all members. The results for country groups and for individual members are shown in Table 1 and Table A2, respectively.

[^1]6. The overall distribution of calculated quota shares for the main country groups is broadly similar to that presented previously using illustrative data through 2003. ${ }^{10}$ The share of the advanced economies declines by about half of a percentage point, but remains well above their actual quota share, while there is an increase of similar magnitude for the transition economies (see Table 1). Developing countries as a group register little change in their calculated quota share relative to the previous illustrative calculations, with increases for all the subgroups except Asia. The decline in the aggregate calculated quota share for Asia reflects mainly the impact of the adjustments to current receipts and payments for re-exports. For both the developing and transition economy groups, their calculated quota shares remain below their share in actual quotas. This also remains the case for the major regional sub-groups, except Asia, which continues to be significantly under-represented relative to calculated quotas based on the updated and adjusted data set.

Sources: Finance and Statistics Departments.
2/ Based on 1992-2004 data and computed as traditionally specified. Reflects the impact of adjustments to current receipts and payments for re-exports, international banking interest, and non-monetary gold.
3/ Based on 1991-2003 illustrative data and computed as traditionally specified. Does not include adjustments to current receipts and payments for re-exports, international banking interest, and non-monetary gold. See Quotas and Voice—Further Considerations (9/02/05, www.imf.org),
4/ The variables shown here differ from the formulation used in the existing quota formulas (see Box 1).
5/ Traditionally specified variable as used in the existing formulas.
6/ Average sum of current receipts and payments, adjusted for re-exports, international banking interest, and non-monetary gold. / Variability of current receipts and net capital inflows, measured as a standard deviation from centered three-year trend. 8/ Average international reserves in 2004 based on end-month data.
9/ Including Korea and Singapore.

[^3]
## Appendix I. Existing Quota Formulas

Quota formulas have evolved over time. A formula that was used in 1944 as a basis for determining the broad configuration of the initial quota distribution became known as the Bretton Woods formula. This formula contained five variables: national income, official reserves, imports, export variability, and the ratio of exports to national income. A multiformula approach was introduced in the early 1960s, when the Bretton Woods formula was supplemented with four other formulas containing the same basic variables but with larger weights for external trade and external variability. The quota formulas were last modified in the context of the Eighth General Review (1982/83) but their basic structure was retained (for a more comprehensive overview of quota formulas, see Alternative Quota FormulasConsiderations, Annex II, (9/27/01, www.imf.org)).
The current five formulas, used from the Eighth to the Eleventh Reviews, are:
Bretton Woods: $Q_{I}=(0.01 Y+0.025 R+0.05 P+0.2276 V C)(1+C / Y)$;
Scheme III: $\quad Q_{2}=(0.0065 Y+0.0205125 R+0.078 P+0.4052 V C)(1+C / Y)$;
Scheme IV: $\quad Q_{3}=(0.0045 Y+0.03896768 R+0.07 P+0.76976 V C)(1+C / Y)$;
Scheme M4: $\quad Q_{4}=0.005 Y+0.042280464 R+0.044(P+C)+0.8352 V C$;
Scheme M7: $\quad Q_{5}=0.0045 Y+0.05281008 R+0.039(P+C)+1.0432 V C ;$
where:
$Q_{1}, Q_{2}, Q_{3}, Q_{4}$ and $Q_{5}=$ Calculated quotas for each formula;
$Y=$ GDP at current market prices for a recent year;
$R=$ twelve-month average of gold, foreign exchange reserves, SDR holdings and reserve positions in the IMF, for a recent year;
$P=$ annual average of current payments (goods, services, income, and private transfers) for a recent five-year period;
$C=$ annual average of current receipts (goods, services, income, and private transfers) for a recent five-year period; and
$V C=$ variability of current receipts, defined as one standard deviation from the centered five-year moving average, for a recent 13-year period.

For each of the four non-Bretton Woods formulas, quota calculations are multiplied by an adjustment factor so that the sum of the calculations across members equals that derived from the Bretton Woods formula. The calculated quota of a member is the higher of the Bretton Woods calculation and the average of the lowest two of the remaining four calculations (after adjustment).

## Appendix II. Selection of the Database, Derivation of Quota Variables, and Other Issues ${ }^{11}$

1. This appendix discusses the required data, the selection of the database, and the derivation of the data series that were used for the quota calculations.

## Required Data

2. The quantification of existing and alternative quota variables used in this paper requires the following data for 184 member countries (converted into SDRs as the common denominator):

- GDP (Gross Domestic Product), for three years (2002-04).
- Current receipts (goods, services, income, and current transfers ${ }^{12}$ ) for 13 years (1992-2004). Current receipts are defined as the credit component of all economic transactions between resident and nonresident entities other than those relating to financial transactions and reserves.
- Current payments (goods, services, income, and current transfers ${ }^{13}$ ) for five years (2000-04). Current payments are defined as the debit component of all economic transactions between resident and nonresident entities other than those relating to financial transactions and reserves.
- $\quad$ Net capital flows for 13 years (1992-2004). Capital flows relate to cross-border transactions in all foreign financial assets and liabilities except reserve assets, Fund credit and loans, and exceptional financing.
- Official reserves (average over the 12 months of 2004), defined as the sum of foreign exchange, SDR holdings, reserve position in the Fund, and monetary gold valued at SDR 35 per fine troy ounce.

3. Errors and omissions have not been included in the measure of variability of current receipts and net capital flows. In many analytical presentations of the balance of payments, errors and omissions are considered financing flows and included with short-term capital. However, errors and omissions are, by definition, a residual item, which reflects recording errors that cannot be ascribed to any particular balance of payments category and staff does

[^4]not believe that recording errors should be a factor in determining quotas. This is fully in line with the definition of capital flows in the balance of payments manual.
4. At the same time, Fund credit and loans, and exceptional financing have been excluded from the variability measure for the same reason that reserve changes have been excluded. Such transactions, including Fund borrowing, payment arrears, and debt forgiveness or rescheduling, represent exceptional measures undertaken to finance balance of payments needs. Exceptional financing flows are normally shown "below the line" because they are not autonomous transactions affecting the balance of payments position of a country. For these reasons, the staff believes that these transactions should not be included in the variability measure.
5. Along these same lines, transactions in both reserve assets and liabilities should, in principle, be excluded from net capital flows so that only autonomous, and not financing, flows are captured. Data on transactions in reserve assets are available for most members in IFS and have been excluded from net capital flows. However, because of the continuing lack of data on reserve liabilities for many members (reserve liabilities are not a standard component in BPM5), changes in reserve liabilities have not been excluded from the measure of net capital flows in this paper.

## Data Sources

6. The database containing the variables used in the quota calculations would ideally have the following attributes: it should be comprehensive; i.e., contains all required datacompiled in line with internationally accepted concepts and definitions-for all members; the data would be from official sources (central banks and national statistical agencies); and the data would be comparable (consistent and coherent) across time and countries. This would ensure similar treatment for all countries' data and facilitate the comparability of results in a transparent manner. It would also be helpful if the database could be updated without major additional use of staff resources.
7. As in past quota updates, the main source of data used in the quota calculations was the Fund's central macroeconomic database of country, regional, and global statistics. This database is managed by the Statistics Department (STA) for international statistical cooperation and publication purposes, and to support the Fund's surveillance and use of Fund resources functions. This database, which encompasses a number of component databases and is collectively known as the Economic Data Facility (EDF), embodies the application of general methodological guidelines for the compilation of economic and financial data. These guidelines promote international comparability and methodological continuity in the database over time. The database is used to compile the Fund publication-IFS. ${ }^{14}$
8. The IFS data are reported to STA by central banks and national statistical agencies, and are based on internationally consistent definitions, such as the fifth edition of the
[^5]Balance of Payments Manual (BPM5) and the 1993 System of National Accounts (SNA). STA makes an effort to compile these data into long time series that are consistent across time and countries. However, gaps exist in some of the data. For instance, there are some missing data for GDP and for current account transactions for more recent years and, as in the past, current receipts and payments data for early years in the case of transition countries are not available. Also, for many members there are data gaps in the capital account of the balance of payments.
9. Missing observations were largely supplemented using the $W E O$ database. ${ }^{15}$ Although $W E O$ data should reflect a presentation of the balance of payments that is consistent with the $B P M 5$, the definition of balance of payments variables does not necessarily need to exactly conform to BPM5 until such time as (a) national compilers have revised the respective country's balance of payments accounts or (b) the staff report for the country reflects the new definitions.
10. At the outset of the development of the database for the quota calculations, STA was aware that for some member countries there existed large differences between the IFS and the $W E O$ data sets. As noted above, some of these differences are related to the use of different classification systems, i.e., use of a national presentation in $W E O$ while the standardized BPM5 presentation was reported to STA. These data discrepancies between the two data sources may also have been influenced by the varying institutional, legal, and accounting contexts of data compilation across member countries (Box A1).

## Data Availability and Adjustments

11. The bulk of Fund members that report balance of payments statistics to STA (167 of the 184) do so on the basis of the BPM5. Data were prepared for current receipts and payments and net capital inflows (as defined above). Where members reported comprehensive balance of payments statistics to STA, the data stored in the IFS database were used without any adjustment. When data were not available for some members for the timeframe required for the quota calculations, estimates were made largely on the basis of the $W E O$. The estimation technique, or gap filling, extrapolates from nearby non-zero data based on growth rates in comparable (but not necessarily identical) WEO series. ${ }^{16}$ For members where neither IFS nor $W E O$ data were available, FIN staff obtained data from Article IV staff reports, country desk, and the Eleventh Review databases.
12. The following sections describe for each of the data categories the general procedures employed by STA to construct the required database for the quota calculations.
[^6]
## Goods and services transactions

13. Data reported by members and maintained in IFS were used for each country. Where there were data gaps after the latest year of reporting to STA, estimates were made by applying the growth rates derived from the $W E O$ for the missing year(s) to the latest reported annual data (debits and credits). When the data gaps were in respect of years prior to the latest reported data to STA, the WEO data were inserted for those years to complete the series. For countries where no data were reported to STA, available WEO data were used.
14. For the 184 member countries, the data source breakdown for credits for the period 1992-2004 is as follows: 99 are derived entirely from IFS reported data; 68 are derived from a combination of IFS and WEO estimates; 7 are derived entirely from $W E O$ estimates; and 10 have neither IFS or WEO data available. The breakdown for debits for the period 2000-04 is as follows: 114 are derived entirely from IFS reported data; 39 are derived from a combination of IFS and WEO estimates; 21 are derived entirely from WEO estimates; and 10 have neither IFS nor $W E O$ data available.

## Income and current transfers

15. Data reported by members and maintained in $I F S$ were used for each country. Where there were data gaps estimates were derived using $W E O$ data series. The adjustment procedure involved adding the change in the balance on transactions from the $W E O$ data to the STA data of the previous year-credits if $W E O$ showed a net credit balance or debits if a net debit balance was shown. Where there were gaps in the data prior to the latest reported data to STA, the net credit or the net debit figures from $W E O$ were substituted directly to estimate income and current transfers credits and debits, respectively.
16. For the 184 member countries, the data source breakdown for credits for the period 1992-2004 is as follows: 99 are derived entirely from IFS reported data; 68 are derived from a combination of IFS and WEO estimates; 9 are derived entirely from $W E O$ estimates; and 8 have neither IFS nor WEO data available. The breakdown for debits for the period 2000-04 is as follows: 114 are derived entirely from IFS reported data; 39 are derived from a combination of IFS and WEO estimates; 23 are derived entirely from $W E O$ estimates, and 8 have neither $I F S$ nor $W E O$ data available.

## Box A1. Methodological Issues

With regard to GDP data, the System of National Accounts (1993 SNA) extended the scope of GDP slightly, adding in some instances, production of goods for own final use as well as including capital formation on mineral exploration, computer software, and artistic originals. Typically, this has resulted in an increase in reported GDP levels of up to 5 percent. By the beginning of 2001, about 50 members had adopted the 1993 SNA for reporting GDP data to the IFS. Some of them have revised historical data. The size of data inconsistencies across countries due to the revisions related to the 1993 SNA is likely to be smaller than other differences related to known measurement problems with GDP (e.g., under coverage of surveys).

With regard to the current receipts and payments (goods, services, income, current transfers, and BPM5's capital account), the BPM5 introduced changes in the conceptual presentation of balance of payments accounts. Broadly, the BPM5 strives to make a clear distinction between transactions and other changes in the accounts-valuation, reclassification, and other adjustments. The latter are included among adjustment items affecting the international investment position (IIP). Also, the BPM5 introduced a distinction between current and capital transfers to increase harmonization with the SNA. These methodologies have been only partially adopted by some of the membership, and it is not feasible to adjust the data so that they are defined consistently across countries. Data are taken as reported by member countries and the changes in methodology may have contributed to slight breaks in some series.

With regard to financial account transactions, the accuracy of financial account data in many countries, including those in the IFS database, is uneven and the data are generally less comprehensive than the other data used for the quota formulas. This reflects classification and practical difficulties encountered by countries in compiling the data. Financial account data, particularly on the private nonbank sector, are generally difficult and resource intensive to compile. The switch from data collection systems based predominantly on government and balance sheet records to systems (particularly surveys) incorporating large nonbank private sector transactions has been slow. Many countries are still in the midst of adapting their collection and recording systems to take account of changes in the composition and magnitude of financial transactions, including new instruments such as financial derivatives. Institutional and accounting requirements for data compilation differ markedly across countries (for example, a recent summary of country reporting practices with respect to direct investment documents the number of gaps in recording and differences in treatment, ${ }^{1}$ and data availability on the private nonbank sector varies. In the $I F S$, in many instances, only aggregates and not component series are reported.

With regard to official reserves, the Data Template on International Reserves and Foreign Currency Liquidity has been approved as the benchmark for the reporting of data to the Fund on official reserves. The Operational Guidelines for the Data Template, issued in 2001, clarify existing concepts on international reserves and provide guidelines for reporting the data on a consistent basis across countries.
${ }^{1}$ See Foreign Direct Investment Statistics: How Countries Measure FDI, 2001, (IMF/OECD,10/29/2003, www.imf.org). In addition, individual country metadata for 54 of the countries that participated in the 2003 Survey of Implementation of Methodological Standards for Direct Investment has recently been posted on the Fund's website.

## "Capital account" transactions ${ }^{17}$

17. The primary source for data on "capital account" transactions was the IFS data series. When $I F S$ values were unavailable, the change in the $W E O$ balance for that year was used to derive an estimate. The paucity of IFS "capital account" data may reflect the inclusion of capital transfers in current transfers by some members. In some cases, the use of the $W E O$ data may have produced some duplication; i.e., use of $W E O$ data for capital transfers, which may have been classified under current transfers in the $I F S$ series.
18. For the 184 member countries, the data source breakdown for the period 1992-2004 is as follows: For the 99 members reporting data in IFS, when capital account information was not available, $W E O$ data were used to derive an estimate, to the extent possible, as explained in paragraph 17. For the other 68 members, a combination of reported data in IFS and WEO data were used, to the extent possible. For the remaining 17 members, published $W E O$ data were the source for 9 members, and no IFS or $W E O$ data were available for 8 members.

## Net capital flows

19. The primary source for data on net capital flows is the IFS financial account data provided by member countries to STA. When $I F S$ values were unavailable, a $W E O$ value was used to fill the gaps, to the extent possible. For the 184 member countries, the data source breakdown for the period 1992-2004 is as follows: 99 are derived entirely from IFS reported data; 68 are derived from a combination of IFS and WEO estimates; 7 are derived entirely from $W E O$ estimates; and 10 have neither IFS nor $W E O$ data available.

## Official reserves

20. The data on official reserves - comprising monetary gold, SDR holdings, reserve position in the Fund, and foreign exchange holdings-were obtained from IFS with monetary gold valued at SDR 35 per fine troy ounce. In deriving annual average holdings of official reserves for 2004 , the data for the 12 months of 2004 were summed and then divided by 12 (or by the number of months for which data were available).

## Gross domestic product

21. The $I F S$ and $W E O$ databases provided GDP data for 182 members. The $I F S$ database is the source of data for 119 members, $W E O$ data were used for 17 members, and $W E O$ growth rates were applied to the latest IFS data to estimate missing data for 46 members. GDP data for 11 members that are compiled and reported on a fiscal year basis were first adjusted to calendar year basis by recalculating the annual GDP as an average of the quarters of the fiscal year.
[^7]
## Valuation

22. The balance of payments and the GDP data series in U.S. dollars were converted to SDRs using period-average exchange rates.

## Missing data series

23. Data that were missing from IFS or WEO were obtained almost entirely from recent staff reports. The only country for which no data for recent years is available is Somalia. In this case, data for the various series were assumed unchanged from the Eleventh Review. Countries for which data for all variables were derived from the recent staff reports are Iraq, Liberia, the Marshall Islands, Palau, Serbia and Montenegro, and Timor Leste. Countries for which only reserves data were derived from staff reports are Democratic Republic of Congo, Kiribati, Turkmenistan, Uzbekistan, and Zimbabwe. For Micronesia, all variables except reserves were derived from staff reports. For San Marino all data except reserves and 2003 and 2004 current receipts and current payments were derived from staff reports. For Afghanistan, data on reserves and current payments were derived from staff reports. However, due to lack of historical data, the variability variable for Afghanistan was derived by applying the ratio of this variable to current receipts from the Eleventh Review to recent data on current receipts. Lastly, in the case of FYR Macedonia, only GDP data were derived from staff reports.

Balance of payments data prior to 2002 for Belgium were estimated as the difference between data for the Belgium-Luxembourg Economic Union and Luxembourg. For China, P.R., and Hong Kong, SAR balance of payments data were adjusted for trade between the mainland and Hong Kong, SAR based on Direction of Trade database.

## Appendix III. Adjustments to the Quota Database ${ }^{18}$

24. It has been a long-standing practice to make adjustments to the variables underlying quota calculations at the point at which discussions on actual quota increases reach a relatively advanced stage. This practice started with adjustment to re-exports in the current account data for Singapore in the Fifth General Review and has since been extended to cover additional countries as well as two additional transactions-international banking and nonmonetary gold exports/imports.
25. The general rationale for making these adjustments is to avoid distortions in the quota calculations, particularly given the importance of openness variables in the current quota formulas:

- The rationale for adjusting for re-exports is that when goods are imported and exported in the same state, the transactions are essentially facilitating transactions between non-residents, and except for any value added generated in the transaction, should not be counted in the country's merchandise trade.
- For international banking interest (IBI), the rationale for including only the net flows (see below) is that the gross flows are interest paid by and received by non-residents, which would unduly inflate income receipts and payments in the BOP.
- The rationale for excluding transactions in non-monetary gold is similar to those for re-exports and IBI-these are transactions between non-residents and their inclusion has no bearing on the member's economic size.

26. Re-exports: As noted, the initial data adjustments for re-exports were introduced in the context of the Fifth General Review (completed in 1970) ${ }^{19}$-with Singapore being the only country adjusted. ${ }^{20}$ The scope of the adjustments increased in subsequent reviews (Table A3).
27. In the database underlying the most recent calculations, current account data were adjusted for 15 countries for which re-exports are a significant share of total exports. The filter for identifying countries to be reviewed as candidates for adjustments was based on a ratio of re-exports exceeding 20 percent of total exports. Re-exports are defined as goods exported in the same state as previously imported-a definition used in the UN Comtrade database. Countries were identified for adjustment based on available data (in most cases from UN Comtrade), which were verified and supplemented by area departments. Adjustments were carried out only for those cases for which area departments confirmed that

[^8]re-exports are significant. The actual adjustment was carried out by subtracting the value of imports used for re-exports from both current receipts and current payments, ${ }^{21}$ thereby retaining the value added contained in re-exported goods (e.g., transport, storage, etc.) in current receipts. ${ }^{22}$
28. International Banking Interest (IBI): Adjustments for IBI were introduced with the Ninth General Review (completed in 1990), ${ }^{23}$ triggered by a change in the reporting of current account data by the United Kingdom. ${ }^{24}$ IBI is defined as interest payments by nonresidents on their borrowing from domestic banks and by domestic banks on deposits held by non-residents. The actual adjustment was made by deducting the lower of gross interest paid and gross interest earned from current payments as well as current receipt-so that only net interest was recorded. Adjustments relied on data provided by the authorities and staff estimates in some cases. Countries selected for adjustment were those viewed as having significant international and/or offshore banking activities. ${ }^{25}$
29. Since the Ninth General Review, adjustments for IBI have been carried out for broadly the same group of countries - comprising mainly the G-10, which was viewed as covering countries with significant international banking activities. ${ }^{26}$ In the Ninth General Review, Panama was also adjusted for interest received and paid by international license banks. More recently, data for China, P.R., and Hong Kong SAR were adjusted for IBI in the context of the 2001 ad-hoc quota increase for China.
30. The data underlying the current calculations have been adjusted for IBI for the G-10 plus Luxembourg and China, P.R., and Hong Kong SAR in keeping with past practice. IBI flows are associated with specific IFS lines. ${ }^{27}$ Consistent with past practice, the actual adjustment was carried out by subtracting the smaller of interest paid and interest received from both current receipts and current payments, leaving IBI in the data on a net basis only. All countries adjusted report data to IFS. ${ }^{28}$

[^9]31. Non-monetary Gold: Adjustments for non-monetary gold were initiated in the Tenth General Review and Switzerland was the only country adjusted. The precedent for this adjustment was set with the quota calculations in Switzerland's membership paper, in which it was argued that transactions in non-monetary gold should be excluded from current account data as they largely reflect the facilitation of trade between non-residents via the large Swiss gold market.
32. For the current quota calculations, underlying variables have been adjusted for nonmonetary gold transactions for Japan and the United States in addition to Switzerland. ${ }^{29}$ According to the current Balance of Payments Manual, non-monetary gold transactions are defined as exports and imports of all gold not held as reserve assets by the authorities, and should be reported to $I F S .^{30}$ The actual adjustment consisted of deducting exports and imports of non-monetary gold in full from current receipts and current payments. Data were taken from the IFS.

Source: Finance Department.
1/ Data for China, P.R., and Hong Kong, SAR were also adjusted in the context of the 2001 ad-hoc quota increase.

[^0]:    ${ }^{1}$ This paper was prepared by a staff team led by Ydahlia Metzgen and including Sheila Bassett, Sherwyn Williams, and Helga Treichel with input from Michael Pedroni.
    ${ }^{2}$ At its Spring Meetings, the International Monetary and Financial Committee (IMFC) underscored the role an ad hoc increase in quotas could play in improving the distribution of quotas and agreed on the need for fundamental reforms. The Committee called upon the Managing Director to work with the IMFC and Executive Board to come forward with concrete proposals for agreement at the Annual Meetings.
    ${ }^{3}$ See Appendix I for details on the five existing formulas.
    ${ }^{4}$ For details of compilation and composition of the data, see Appendix II.
    ${ }^{5}$ In consultation with area departments, it was agreed that Eleventh General Review data would be used for Somalia and as input for the calculation of variability for Afghanistan.
    ${ }^{6}$ See Alternative Quota Formulas-Considerations (9/27/01, www.imf.org), pp. 25-26.

[^1]:    ${ }^{7}$ The adjustments were made in close collaboration with area departments.
    ${ }^{8}$ Afghanistan, Barbados, China, P.R., and Hong Kong SAR, Cyprus, Dominican Republic, El Salvador, Fiji, Grenada, Kenya, Maldives, Panama, Seychelles, Singapore, St. Lucia, and United Arab Emirates.
    ${ }^{9}$ See the Chairman's Concluding Remarks: Quotas and Voice-Further Considerations (9/22/05, www.imf.org). See also Public Information Notice: IMF Executive Board Informally Discusses Quota Formulas (11/7/01, www.imf.org) and Public Information Notice: IMF Executive Board Discusses Quota Formulas (6/14/02, www.imf.org).

[^2]:    ${ }^{10}$ See Quotas and Voice—Further Considerations (9/2/05, www.imf.org).

[^3]:    9/ Including Korea and Singapore.

[^4]:    ${ }^{11}$ Balance of payments and GDP data for the updated quota calculations were compiled by STA in coordination with FIN. The STA team comprised Qi He, Paul Austin, Lisbeth Rivas, Olga Laveda, and Dwayne Raiford.
    ${ }^{12}$ The current Balance of Payments Manual, fifth edition (BPM5) distinguishes current and capital transfers, unlike the earlier fourth edition (BPM4) that included all transfers in the current account. Accordingly, to help ensure comparability with previous quota calculations, both current and capital transfers-excluding exceptional financing-are included here in the current account.
    ${ }^{13}$ Ibid.

[^5]:    ${ }^{14}$ In this paper, the data drawn from the EDF are referred to as the IFS database, following the practice in past quota review papers.

[^6]:    ${ }^{15}$ The cut off date for both IFS and WEO data was January 31, 2006.
    ${ }^{16}$ This method has been used to fill gaps for the purpose of publishing world and regional summary tables in the Balance of Payments Statistics Yearbook (BOPSY), Part 2, and was used in External Review of Quota Formulas-Quantification (4/12/2001, ww.imf.org).

[^7]:    17 "Capital account" (in quotation marks) refers to the capital account as defined in BPM5.

[^8]:    ${ }^{18}$ The updated quota calculations were prepared by FIN in consultation with Area Departments. The FIN team comprised Messrs. Mandeng and Williams, Mmes. Bassett and Treichel, and Messrs. Khan, Schmittmann, and Pedroni.
    ${ }^{19}$ See Press Release No. 788, 2/11/1970.
    ${ }^{20}$ The issue of sizeable re-exports was well known and the membership process for Singapore had set the precedent by presenting quota calculations based on data adjusted for re-exports.

[^9]:    ${ }^{21}$ In cases where data for the value of imports used for re-exports were not available, the value of re-exports was deducted from both current receipts and current payments.
    ${ }^{22}$ No adjustments were being made for export processing activities, as these are not considered fundamentally different from other economic activities, with the possible exception of a low value added. However, the use of a value added threshold in excluding certain export processing activities is very difficult to justify.
    ${ }^{23}$ See Press Release No. 90/34, 7/2/1990.
    ${ }^{24}$ In the context of the Ninth General Review, it was noted that the United Kingdom had changed reporting on banking interest from a net to a gross basis.
    ${ }^{25}$ In practice, no adjustment was ever carried out for an off-shore banking center.
    ${ }^{26}$ In the Ninth General Review, Belgium and Luxembourg were treated as one entity for quota calculations. Starting with the Tenth General Review, Luxembourg was separately adjusted for IBI. Switzerland only joined the Fund in 1992.
    ${ }^{27}$ Specifically, IBI received is recorded in the BOP on line 2370 and IBI paid on line 3370 ("Other Investment Income").
    ${ }^{28}$ Data for Belgium and Luxembourg were reported jointly through 2001 and for the two countries separately thereafter. The joint series was split in consultation with the area department.

[^10]:    ${ }^{29}$ No adjustments were made to the data for the United Kingdom, which is also a large gold market, because it is reporting transactions related to non-monetary gold in the financial account.
    ${ }^{30}$ Specifically, exports are recorded on line 2180 in the BOP and imports on line 3180 under "goods".
